

## تمرین‌های تشریحی:

## سوال ۱:

الف) برای بدست آوردن تمام itemset های مکرر توسط apriori، لازم است که مجموعه‌های C و L را تشکیل دهیم:

$$MinSupport = 60\% \rightarrow minsupport = 3$$

$$C_1 = \{A: 4, B: 3, C: 2, D: 3, E: 2, K: 1\}$$

$$L_1 = \{A: 4, B: 3, D: 3\}$$

$$C_2 = \{AB: 4, AD: 3, BD: 3\}$$

$$L_2 = \{AB: 4, AD: 3, BD: 3\}$$

$$C_3 = \{ABD: 3\}$$

$$L_3 = \{ABD: 3\}$$

پس itemset های مکرر برابرند با:

$$\{A: 4, B: 3, D: 3, AB: 4, AD: 3, BD: 3, ABD: 3\}$$

ب) برای بدست آوردن Association Rule های قوی که با metarule داده شده مطابقت دارند، باید از itemset مکرر ABD استفاده کنیم. همه rule ها را امتحان می‌کنیم:

$$\forall x \in transaction, buys(x, A) \text{ and } buys(x, B) \rightarrow buys(x, D)$$

$$Confidence: \frac{3}{4} = 75\%, support = \frac{3}{4} = 75\%$$

این rule قوی نیست.

$$\forall x \in transaction, buys(x, A) \text{ and } buys(x, D) \rightarrow buys(x, B)$$

$$Confidence: \frac{4}{4} = 100\%, support = \frac{3}{4} = 75\%$$

این rule قوی است.

$\forall x \in \text{transaction}, \text{buys}(x, B) \text{ and } \text{buys}(x, D) \rightarrow \text{buys}(x, A)$

Confidence:  $\frac{4}{4} = 100\%$ , support =  $\frac{3}{4} = 75\%$

این rule قوی است.

## سوال ۲:

الف) برای بررسی همبستگی و استقلال خرید hot dogs و hamburgers، از معیار lift استفاده می‌کنیم. برای محاسبه lift داریم:

$$\text{lift} = \frac{P(\text{hotdogs} \cup \text{hamburgers})}{P(\text{hotdogs})P(\text{hamburgers})} = \frac{\frac{2000}{5000}}{\frac{3000}{5000} * \frac{2500}{5000}} = \frac{4}{3} = 1.33$$

می‌دانیم در صورتی که مقدار lift برای دو itemset برابر با یک باشد، دو itemset از هم مستقل خواهند بود. در صورتی که بزرگتر از یک باشد، همبستگی مثبت دارند و در صورتی که کوچکتر از یک باشد، همبستگی منفی دارند. در اینجا چون مقدار lift بزرگتر از یک است، رابطه همبستگی خرید hot dogs و hamburgers یک رابطه همبستگی مثبت است.

ب) برای محاسبه all-confidence و cosine داریم:

$$\text{Allconf}(\text{hotdogs}, \text{hamburgers}) = \frac{\text{sup}(\text{hotdogs} \cup \text{hamburgers})}{\max(\text{sup}(\text{hotdogs}), \text{sup}(\text{hamburgers}))} = \frac{2000}{3000} = 0.67$$

$$\text{Cosine}(\text{hotdogs}, \text{hamburgers}) = \frac{\text{sup}(\text{hotdogs} \cup \text{hamburgers})}{\sqrt{\text{sup}(\text{hotdogs}) * \text{sup}(\text{hamburgers})}} = \frac{2000}{\sqrt{3000 * 2500}} = 0.73$$

## سوال ۳:

برای پیدا کردن itemsetهای مکرر با استفاده از constraint داده شده با استفاده از الگوریتم FPGrowth، ابتدا مقدار support را حساب می‌کنیم و itemsetهای غیرمکرر را حذف می‌کنیم و باقی itemsetها را برحسب value به صورت نزولی مرتب می‌کنیم. Water و Tea حذف می‌شوند:

|              |   |
|--------------|---|
| Milk(3000)   | 3 |
| Butter(2500) | 2 |
| Peanut(2300) | 5 |
| Chips(2000)  | 4 |
| Cake(1500)   | 2 |
| Cheese(1200) | 3 |

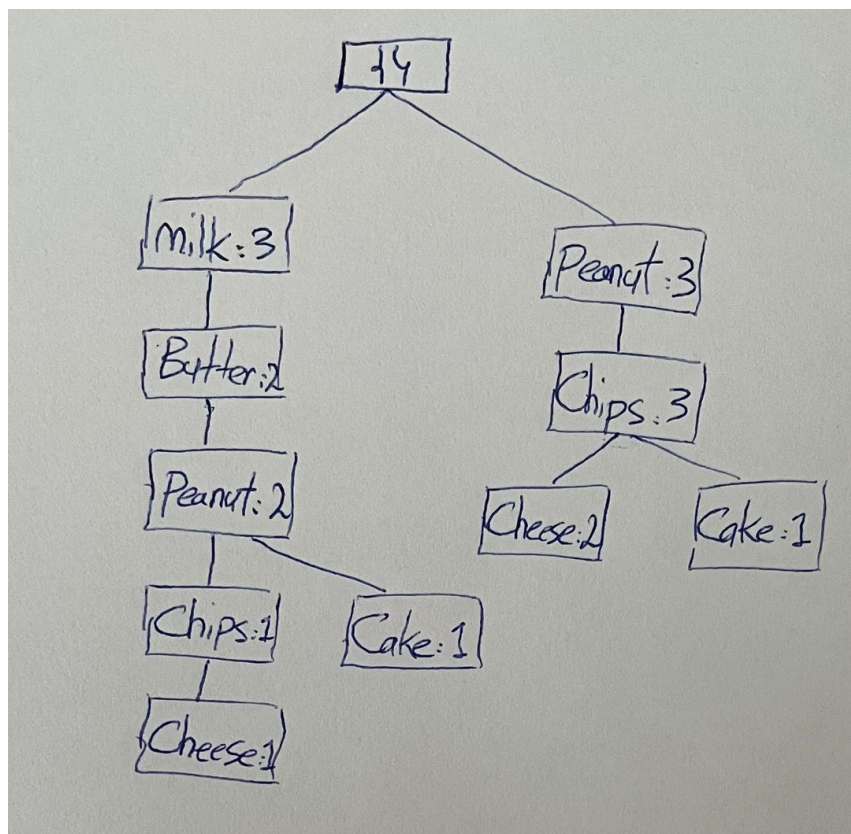

و جدول جدید به این صورت درمی آید:

| Tid | Items                               | Freq items, ordered by value, desc  |
|-----|-------------------------------------|-------------------------------------|
| 100 | Milk, Peanut, Butter, Cake          | Milk, Butter, Peanut, Cake          |
| 200 | Cake, Chips, Peanut, Tea            | Peanut, Chips, Cake                 |
| 300 | Cheese, Chips, Peanut               | Peanut, Chips, Cheese               |
| 400 | Chips, Milk, Cheese, Butter, Peanut | Milk, Butter, Peanut, Chips, Cheese |
| 500 | Milk, Water                         | Milk                                |
| 600 | Chips, Peanut, Cheese               | Peanut, Chips, Cheese               |

و FP-list به این صورت خواهد بود:

FP-list: Milk - Butter - Peanut - Chips - Cake - Cheese

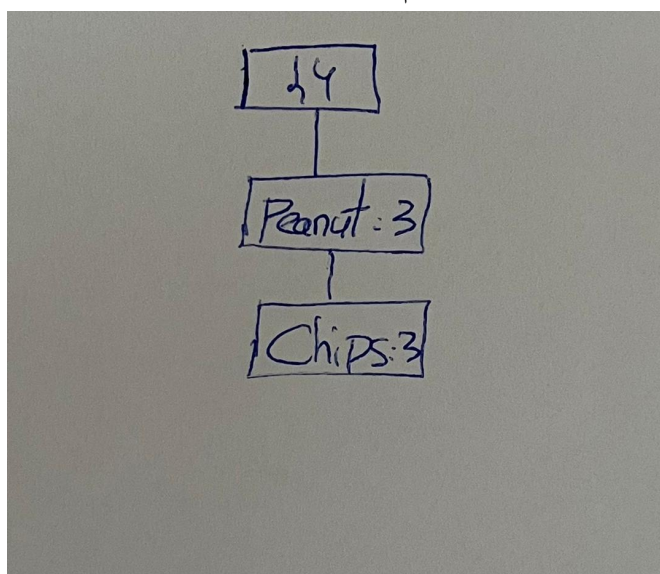

لذا FP-Tree به این صورت خواهد بود:

ابتدا Cheese-conditional pattern base را حساب می کنیم:

$\{(Peanut, Chips): 2, (Milk, Butter, Peanut, Chips): 1\}$

با حذف غیرمکررها به درخت جدید می رسمیم:

چون درخت به یک مسیر تبدیل شده است، itemset های حاصل از cheese برابرند با:

$\{(Cheese): 3, (Peanut, Cheese): 3, (Chips, Cheese): 3, (Peanut, Chips, Cheese): 3\}$

حال Cake-conditional pattern base را حساب می‌کنیم:

$\{(Peanut, Chips): 1, (Milk, Butter, Peanut): 1\}$

با حذف غیرمکررها تنها یک  $(Peanut): 2$  می‌ماند. لذا itemset های حاصل از Cake برابرند با:

$\{(Cake): 2, (Peanut, Cake): 2\}$

نهایتاً هم Chips-conditional pattern base را حساب می‌کنیم:

$\{(Peanut): 3, (Milk, Butter, Peanut): 1\}$

با حذف غیرمکررها تنها یک  $(Peanut): 4$  می‌ماند. لذا itemset های حاصل از Chips برابرند با:

$\{(Chips): 4, (Peanut, Chips): 4\}$

دقت کنید که لازم نیست باقی conditional pattern base ها ساخته شوند، زیرا دیگر در شرط داده شده صدق نمی‌کنند. لذا تمامی itemset های مکرر با شرایط گفته شده یافت شدند.

## تمرین تشریحی امتیازی:

### سوال ۱:

الف) برای اینکه مشخص کنیم کدام گره‌ها بازدید می‌شوند، چک می‌کنیم کدام گره‌ها با تابع هش داده شده مطابقت دارند:

$L_1: 1 < 4 \text{ and both in transaction} \rightarrow \text{gets visited}$

$L_2: \text{doesn't get visited because no combination is possible}$

$L_3: 1 < 5 < 8 \text{ and all in transaction} \rightarrow \text{gets visited}$

$L_4: \text{doesn't get visited because no combination is possible}$

$L_5: 1 < 3 \text{ and all in transaction} \rightarrow \text{gets visited}$

$L_6: \text{doesn't get visited because no combination is possible}$

$L_7: \text{doesn't get visited because no combination is possible}$

$L_8: \text{doesn't get visited because no combination is possible}$

$L_9: 3 < 4$  and all in transation  $\rightarrow$  gets visited  
 $L_{11}: 3 < 5$  and all in transation  $\rightarrow$  gets visited  
 $L_{12}$ : doesn't get visited because no combination is possible

ب) با استفاده از گروه‌های فوق، candidate itemset‌ها برابرند با:

{145, 158, 458}

## تمرین‌های عملی:

In this computer assignment, we first analyze data for a market basket dataset and then, we try to mine frequent itemsets and association rules according to this data.

### Question 1:

We first read the given csv file and check the first 5 rows to see how the given data look like:

|   | 0             | 1         | 2          | 3                | 4            | 5                | 6    | 7              | 8            | 9            | 10             | 11        | 12    | 13    | 14            | 15     | 16                | 17              | 18      | 19        |
|---|---------------|-----------|------------|------------------|--------------|------------------|------|----------------|--------------|--------------|----------------|-----------|-------|-------|---------------|--------|-------------------|-----------------|---------|-----------|
| 0 | shrimp        | almonds   | avocado    | vegetables mix   | green grapes | whole weat flour | yams | cottage cheese | energy drink | tomato juice | low fat yogurt | green tea | honey | salad | mineral water | salmon | antioxydant juice | frozen smoothie | spinach | olive oil |
| 1 | burgers       | meatballs | eggs       | NaN              | NaN          | NaN              | NaN  | NaN            | NaN          | NaN          | NaN            | NaN       | NaN   | NaN   | NaN           | NaN    | NaN               | NaN             | NaN     | NaN       |
| 2 | chutney       | NaN       | NaN        | NaN              | NaN          | NaN              | NaN  | NaN            | NaN          | NaN          | NaN            | NaN       | NaN   | NaN   | NaN           | NaN    | NaN               | NaN             | NaN     | NaN       |
| 3 | turkey        | avocado   | NaN        | NaN              | NaN          | NaN              | NaN  | NaN            | NaN          | NaN          | NaN            | NaN       | NaN   | NaN   | NaN           | NaN    | NaN               | NaN             | NaN     | NaN       |
| 4 | mineral water | milk      | energy bar | whole wheat rice | green tea    | NaN              | NaN  | NaN            | NaN          | NaN          | NaN            | NaN       | NaN   | NaN   | NaN           | NaN    | NaN               | NaN             | NaN     | NaN       |

As you can see, we need to change the structure of the dataframe. First, as you can see, each row is a transaction in the market basket, but since some rows have more items, some rows have many NaN values, which is meaningless.

To do so, we need to make a dataframe that each column represents a unique item and each row represents a transaction and if a transaction contains an item, the value for that item and that transaction becomes True. Otherwise, it becomes False. We use 'TransactionEncoder' from mlxtend library to generate the new dataframe. There are more steps for preprocessing. If we check the

items’ names, we see that some items contain whitespaces at the beginning and ending of the name, which need to get removed. Also all items should get lowercase, so that same items but with different cases become similar in the end. Here is the result of preprocessing step according to these explanations:

|      | almonds | antioxydant juice | asparagus | avocado | babies food | bacon | barbecue sauce | black tea | blueberries | body spray | ... | turkey | vegetables mix | water spray | white wine | whole weat flour | whole wheat pasta | whole wheat rice | yams  | yogi ca |
|------|---------|-------------------|-----------|---------|-------------|-------|----------------|-----------|-------------|------------|-----|--------|----------------|-------------|------------|------------------|-------------------|------------------|-------|---------|
| 0    | True    | True              | False     | True    | False       | False | False          | False     | False       | False      | ... | False  | True           | False       | False      | True             | False             | False            | True  | Fal     |
| 1    | False   | False             | False     | False   | False       | False | False          | False     | False       | False      | ... | False  | False          | False       | False      | False            | False             | False            | False | Fal     |
| 2    | False   | False             | False     | False   | False       | False | False          | False     | False       | False      | ... | False  | False          | False       | False      | False            | False             | False            | False | Fal     |
| 3    | False   | False             | False     | True    | False       | False | False          | False     | False       | False      | ... | True   | False          | False       | False      | False            | False             | False            | False | Fal     |
| 4    | False   | False             | False     | False   | False       | False | False          | False     | False       | False      | ... | False  | False          | False       | False      | False            | False             | True             | False | Fal     |
| ...  | ...     | ...               | ...       | ...     | ...         | ...   | ...            | ...       | ...         | ...        | ... | ...    | ...            | ...         | ...        | ...              | ...               | ...              | ...   | ...     |
| 7496 | False   | False             | False     | False   | False       | False | False          | False     | False       | False      | ... | False  | False          | False       | False      | False            | False             | False            | False | Fal     |
| 7497 | False   | False             | False     | False   | False       | False | False          | False     | False       | False      | ... | False  | False          | False       | False      | False            | False             | False            | False | Fal     |
| 7498 | False   | False             | False     | False   | False       | False | False          | False     | False       | False      | ... | False  | False          | False       | False      | False            | False             | False            | False | Fal     |
| 7499 | False   | False             | False     | False   | False       | False | False          | False     | False       | False      | ... | False  | False          | False       | False      | False            | False             | False            | False | Fal     |
| 7500 | False   | False             | False     | False   | False       | False | False          | False     | False       | False      | ... | False  | False          | False       | False      | False            | False             | False            | False | Tr      |

Pay attention! All columns and rows couldn’t be shown in this picture.

Now let’s plot the sells for each item and see which items are the most selling items:

As you can see, the most selling items in the market are the items that are used the most in everyday life like: mineral water, eggs and tomato. Also these items seem to be popular among a wide variety of people or are affordable for

them, while items that are not sold that much seem to be some specific-purpose items like: babies food and hand protein bar. These items are not popular that much.

### Question 2:

A:

The number of transactions are the number of rows in the new dataframe, which is 7501.

B:

The number of unique items are the number of columns in the new dataframe, which is 119.

C:

```
Top 5 most selling items with number of sells:
chocolate      1229
french fries    1282
spaghetti       1306
eggs            1348
mineral water   1788
```

D:

```
Number of transactions in which black tea is bought: 107
```

### Question 3:

A:

Let's see the result using Apriori with different parameters:

- min-support = 0.003 and min-length = 2:

|      | support  | itemsets  | length |
|------|----------|---|--------|
| 115  | 0.005199 | (almonds, burgers)                                | 2      |
| 116  | 0.003066 | (almonds, cake)                                   | 2      |
| 117  | 0.005999 | (almonds, chocolate)                              | 2      |
| 118  | 0.006532 | (eggs, almonds)                                   | 2      |
| 119  | 0.004399 | (french fries, almonds)                           | 2      |
| ...  | ...      | ...   | ...    |
| 1438 | 0.003066 | (ground beef, spaghetti, pancakes, mineral water) | 4      |
| 1439 | 0.003066 | (tomatoes, spaghetti, ground beef, mineral water) | 4      |
| 1440 | 0.003333 | (milk, spaghetti, olive oil, mineral water)       | 4      |
| 1441 | 0.003066 | (milk, spaghetti, shrimp, mineral water)          | 4      |
| 1442 | 0.003333 | (tomatoes, milk, spaghetti, mineral water)        | 4      |

1328 rows × 3 columns

Min support = 0.003, Min length = 2 using Apriori. Spent time: 1.3110504150390625s. Total found = 1328

- min-support = 0.03 and min-length = 2:

|    | support  | itemsets                           | length |
|----|----------|------------------------------------|--------|
| 36 | 0.033196 | (eggs, chocolate)                  | 2      |
| 37 | 0.034395 | (french fries, chocolate)          | 2      |
| 38 | 0.032129 | (milk, chocolate)                  | 2      |
| 39 | 0.052660 | (chocolate, mineral water)         | 2      |
| 40 | 0.039195 | (spaghetti, chocolate)             | 2      |
| 41 | 0.036395 | (eggs, french fries)               | 2      |
| 42 | 0.030796 | (milk, eggs)                       | 2      |
| 43 | 0.050927 | (eggs, mineral water)              | 2      |
| 44 | 0.036528 | (eggs, spaghetti)                  | 2      |
| 45 | 0.033729 | (french fries, mineral water)      | 2      |
| 46 | 0.035729 | (frozen vegetables, mineral water) | 2      |
| 47 | 0.031063 | (green tea, mineral water)         | 2      |
| 48 | 0.040928 | (ground beef, mineral water)       | 2      |
| 49 | 0.039195 | (ground beef, spaghetti)           | 2      |
| 50 | 0.047994 | (milk, mineral water)              | 2      |
| 51 | 0.035462 | (milk, spaghetti)                  | 2      |
| 52 | 0.033729 | (pancakes, mineral water)          | 2      |
| 53 | 0.059725 | (spaghetti, mineral water)         | 2      |

Min support = 0.03, Min length = 2 using Apriori. Spent time: 0.03237652778625488s. Total found = 18

- min-support = 0.3 and min-length = 2:

| support | itemsets | length |
|---------|----------|--------|
|---------|----------|--------|

Min support = 0.3, Min length = 2 using Apriori. Spent time: 0.005596160888671875s. Total found = 0

As you can see, as min-support increases, total number of frequent itemsets found decreases, in such way that for min-support = 0.3, algorithm couldn't find any frequent itemset. In contrast, if we decrease the min-support, some itemsets get mined that may not be interesting for us but satisfy the constraint. As you can see, when we put min-support = 0.003, 1328 itemsets get mined, which many of them are not that interesting for us. By using min-support = 0.03, we get some interesting itemsets that aren't small(18 frequent itemsets are enough).

B:

The best value for min-support is 0.03 according to the above explanation. Using 0.003 will result in mining itemsets that are not interesting for us and using 0.3 will result in mining no itemsets, but using 0.03 will result in enough and interesting itemsets, which is good for us.

C:

Let's see the result using FPGrowth with given parameters(28 itemsets are mined):

| support  | itemsets        | length |
|----------|-----------------|--------|
| 0.238368 | (mineral water) | 1      |
| 0.132116 | (green tea)     | 1      |

|          |                     |   |
|----------|---------------------|---|
| 0.076523 | (low fat yogurt)    | 1 |
| 0.071457 | (shrimp)            | 1 |
| 0.065858 | (olive oil)         | 1 |
| 0.063325 | (frozen smoothie)   | 1 |
| 0.179709 | (eggs)              | 1 |
| 0.087188 | (burgers)           | 1 |
| 0.062525 | (turkey)            | 1 |
| 0.129583 | (milk)              | 1 |

Top 3 rules by lift:

$\forall x \in \text{transaction}, \text{buys}(x, \text{spaghetti}) \rightarrow \text{buys}(x, \text{ground beef})$

$\forall x \in \text{transaction}, \text{buys}(x, \text{ground beef}) \rightarrow \text{buys}(x, \text{spaghetti})$

$\forall x \in \text{transaction}, \text{buys}(x, \text{ground beef}) \rightarrow \text{buys}(x, \text{mineral water})$

B:

Let's see the result using FPGrowth with given parameters, sorted by lift in descending order(5 rules are mined):

|   | antecedents         | consequents     | antecedent support | consequent support | support  | confidence | lift     | leverage | conviction |
|---|---------------------|-----------------|--------------------|--------------------|----------|------------|----------|----------|------------|
| 4 | (ground beef)       | (spaghetti)     | 0.098254           | 0.174110           | 0.039195 | 0.398915   | 2.291162 | 0.022088 | 1.373997   |
| 3 | (ground beef)       | (mineral water) | 0.098254           | 0.238368           | 0.040928 | 0.416554   | 1.747522 | 0.017507 | 1.305401   |
| 1 | (frozen vegetables) | (mineral water) | 0.095321           | 0.238368           | 0.035729 | 0.374825   | 1.572463 | 0.013007 | 1.218270   |
| 0 | (milk)              | (mineral water) | 0.129583           | 0.238368           | 0.047994 | 0.370370   | 1.553774 | 0.017105 | 1.209650   |
| 2 | (pancakes)          | (mineral water) | 0.095054           | 0.238368           | 0.033729 | 0.354839   | 1.488616 | 0.011071 | 1.180529   |

Min support = 0.03, Min confidence = 0.35 using FPGrowth. Spent time: 0.13147830963134766s. Total found = 5

Top 3 rules by lift:

$\forall x \in \text{transaction}, \text{buys}(x, \text{ground beef}) \rightarrow \text{buys}(x, \text{spaghetti})$

$\forall x \in \text{transaction}, \text{buys}(x, \text{ground beef}) \rightarrow \text{buys}(x, \text{mineral water})$

$\forall x \in \text{transaction}, \text{buys}(x, \text{frozen vegetables}) \rightarrow \text{buys}(x, \text{mineral water})$

The number of mined rules decreases, since fewer rules can satisfy the new constraint(min-confidence has increased in this part) and because of that, fewer rules can get mined in this part.
